

The Information Security Office presents SECURITY AWARENESS WEEK 2008. All events are free and open to the public, and will take place in a variety of locations around campus. Below you will find descriptions of our sessions, as well as a full schedule of events. Arm yourself with trustworthy advice on how to keep your data and your identity safe. These tips will help keep the internet villains "shaken" - not stirred.

GENERAL SESSIONS

ANTIVIRUS IS NOT ENOUGH: Securing Home Computers

Bond had the ingenious inventor Q to help keep him out of trouble, but we mere mortals don't have such a luxury. And, while we have IT support at work to help us with safety, we don't usually have a resident "geek" to do this at home. At this session, you will get tips on your own "homeland" security, and learn about cool tools for assessing and ensuring security.

LICENSE TO STEAL: What Your IT Staff CAN'T Do For You

Q created amazing gadgets to help Bond stay safe during his missions, but 007 would have been lost without Miss Moneypenny's safe practices. The same goes for you and your office. While your IT staff provides support with security software, the bad guys are working diligently to thwart your security gadgets and use your trusting nature against you. Learn from our experts what you can do to outsmart them.

FROM RUSSIA WITHOUT LOVE: Identity Theft & Phishing

Bond had a virtual bevy of babes, but they usually did not have his best interests at heart. Since he knew he had a big target on his back, he stayed busy thwarting the villains' plans. Learn what you can do to keep the bad guys at bay online.

SPY ANOTHER DAY: Botnets and Spyware

Hackers can't use your computer to provoke hostilities between nations – or can they? Spyware can allow the bad guys to steal your identity; hackers build empires of computers that they use for malicious intent; viruses, worms, and trojans can take down an entire organization. Learn about tools to prevent villains from using you as a pawn in their dastardly plans.

NOT FOR YOUR EYES ONLY: Securing Wireless and Mobile Devices

Q would scoff at the idea of open access to his gadgets. You should view public wireless the same way. Learn about how to use wireless devices safely so that you keep your information safe from those nasty villains who are working tirelessly to intercept it.

PROFILES ARE FOREVER: Safe Surfing & Social Networking

We can guarantee that M would frown on 007 setting up a MySpace or Facebook page, or accepting end user agreements so he could send pictures of himself online to his many hotties. Come learn about safe surfing, limiting your digital data online, and understanding what a sinister web page looks like.
